

HOW TO RUN - University ERP System

1. Prerequisites

- **Java Development Kit (JDK):** Version 17 or higher.
- **Build Tool:** Apache Maven.
- **Database:** MySQL Server (Version 8.0 or higher).

2. Database Setup

The application requires two separate databases (`auth_db` and `erp_db`).

1. Open your MySQL client (Workbench or Command Line).
2. Locate the `/database/` folder in this submission.
3. **Run `auth_db_seed.sql`:** This creates the authentication schema and inserts default users.
4. **Run `erp_db_seed.sql`:** This creates the ERP schema (courses, students, settings) and applies necessary constraints.

3. Application Configuration (Critical)

The database connection settings are defined in `src/main/java/edu/univ/erp/data/DBConnectionManager.java`.

- **Default Configured User:** `root`
- **Default Configured Password:** `"Enter your SQL password here"`
- **Port:** `3306`

IMPORTANT: If your local MySQL root password is different, you **must** update the `DB_DB_PASSWORD` constant in `DBConnectionManager.java` and recompile before running.

4. How to Build and Run

1. Open the project folder in your IDE (IntelliJ IDEA / Eclipse) or terminal.
2. **Build:** Run `mvn clean install` to download dependencies (MySQL Connector, jBCrypt, etc.) and compile.
3. **Run:** Execute the main class:
 - **Class:** `edu.univ.erp.ui.CommonWindows.LoginWindow`

5. Default Login Credentials

Use these accounts to test the different roles. Passwords are hashed in the database using BCrypt.

Role	Username	Password
Admin	admin1	adminpass
Instructor	inst1	instpass
Student	stu1	stupass1
Student	stu2	stupass2

6. Troubleshooting

- **"Connection Refused"**: Ensure MySQL is running and the password in `DBConnectionManager.java` matches your local DB setup.
- **"Table 'users_auth' doesn't exist"**: Ensure you ran the SQL seed scripts in the correct order.
- **Maintenance Mode Banner**: If the banner is visible immediately upon login, log in as `admin1` and toggle Maintenance Mode **OFF** in the dashboard.
